                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an Ecok I adaptor, digested with Not I, and cloned directionally into pTTT3-Pac vector. The oligonaries in the used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (d1)1% tail Ihe sequence tags for this library are: fetal eyes, AGAATCAAGA; lens, CGATTAAGTG; retina, CGGTC, keina Foveai and Macular, GTCC, RPE and Chorold, ACCTA.                                                                                                           Institut fuer Molekulare Genetik, Berlin). cDNAs for EST analysis were selected following oligonucleotide hybridization fingerprinting of arrayed clones from cebrafish late somitogenesis (26 ss), adult liver or embryonic shield stage (5.6 h) libraries Fingerprint data were used to computationally cluster cDNAs, and a single cDNA from each cluster was chosen for sequencing. In some cases multiple members of the same cluster were sequenced to assess clustering parameters or single chones.
                                                                                                                                                                                                                                                                                                                                                                                                                               double-stranded cDNA was ligated to Sal I adaptors (API.), digested with Not I and cloned into the Not I and Sal I sites of the pSFORTI vector (BKL). Library was constructed
